Staff Software Engineer - Global KYC and Onboarding

105000 - 130000 GBP Annual

London

Company Description

Wise is a global technology company, building the best way to move and manage the world's money. Min fees. Max ease. Full speed.

Whether people and businesses are sending money to another country, spending abroad, or making and receiving international payments, Wise is on a mission to make their life easier and save them money.

As part of our team, you will be helping us create an entirely new network for the world's money. For everyone, everywhere.

More about our mission.

Job Description

We are the Global KYC and Onboarding squad in the Servicing department and we have a mission: to enable teams at Wise to expand and fine-tune the business in a "config change" manner all across the globe, while remaining compliant and safe for the customers. There are three teams in the squad: Business Onboarding Verification, Personal Onboarding Verification and Wise Platform Verification (this is our B2B platform).

All of the teams are diverse, cross-functional groups passionate about solving complex problems with elegant solutions. We bring together backend and frontend engineers, mobile developers, designers, data analysts, and product managers who collaborate closely to deliver exceptional customer experiences. Our teams are responsible for the critical verification journeys that business and personal customers complete before using Wise's products. We own the entire verification lifecycle – from document collection flows and automated review

systems to agent tooling and compliance monitoring. We operate with high autonomy, make data-driven decisions, and celebrate both technical excellence and customer impact. As a team that touches both regulatory requirements and customer experience, we have unique opportunities to innovate in a space traditionally resistant to change.

By joining one of our teams, you'll directly impact these customers by transforming a traditionally frustrating experience into one that's fast, intuitive, and fair. Your code will help individuals and small businesses access global banking faster, enable entrepreneurs to pay international employees on time, and allow people like you and your teammates support their families across borders without friction. We're not just building verification systems – we're removing barriers that stand between our customers and their financial freedom.

We need like-minded engineers in all the teams in the squad, so we'll use the interview process to discover where your unique skills shine brightest. Ultimately, we want to match you with the team that perfectly aligns with your experience and sets you up for success!

Qualifications

As a Senior Backend Engineer (IC4), you'll provide technical leadership within your team, designing and implementing scalable, resilient systems that power our verification platform. You'll tackle complex engineering challenges, mentor other engineers, and collaborate with product and design to create solutions that make verification faster, more accurate, and more customer-friendly.

What You'll Do:

- Design, build and maintain high-performance, scalable backend services using Java, Spring Boot, and cloud technologies
- Lead technical initiatives that improve our verification systems, focusing on automation, reliability, and performance
- Collaborate with product managers to translate business requirements into technical solutions
- Mentor junior engineers, providing technical guidance and code reviews
- Drive architectural decisions and technical strategy for verification systems
- Build internal tools that help our verification agents work efficiently
- Contribute to our engineering culture through knowledge sharing and best practices

What We're Looking For:

You have 10+ years of Java 8+ knowledge, recent experience with Spring framework

Experience in working with SQL and NoSQL database

Strong system design skills with experience building distributed, high-throughput services

Track record of leading technical initiatives and mentoring other engineers

Strong understanding of security best practices and data protection principles

Excellent problem-solving skills and attention to detail

Ability to communicate complex technical concepts clearly to both technical and non-technical audiences

Experience with financial or KYC verification systems is a plus
